

Amazon Sales — Performance Report

Performance review and analytics build • Apr-Jun 2022 • MySQL + Power BI

₹69.6M Realized revenue	₹8.3M Revenue leakage	13.0% Cancellation rate	₹694 Avg order value	–12.9% June MoM trend
-----------------------------------	---------------------------------	-----------------------------------	--------------------------------	---------------------------------

Project Summary

An end-to-end analytics project taking a raw Amazon India sales table all the way to an interactive Power BI dashboard and a business-ready set of recommendations — spanning extensive data cleaning, SQL analysis, dimensional modelling, DAX development, dashboard design, and financial/operational storytelling.

End-to-end workflow: 131,146 raw rows cleaned to 127,200, then modelled and analysed.

Data cleaning & quality assurance

The raw export was far from analysis-ready. It was cleaned and quality-assured before any analysis — reducing 131,146 messy rows to a reliable 127,200-row table:

Check	Raw (original)	After cleaning
Rows	131,146	127,200 (–3,946)
Columns	24 (messy headers)	23 (snake_case)
Exact duplicates	2,210	0
Blank / null values	present	0
Blank courier status	6,959	0
Amount column	stored as text	numeric
Date column	stored as text	date type
Junk column	'Unnamed: 22'	removed

- Removed 3,946 problem rows (~3%) — including **1,754 fully-empty records** (no amount, currency, or courier status) and ~2,200 exact duplicates.

- Inferred “Shipped” courier status for **5,205 rows** that had a valid sale amount but a blank status — an imputation that does not affect revenue figures (which use the order status field).
- Standardised all 24 column headers (spaces, hyphens, mixed case → clean snake_case).
- Fixed data types: **Amount** and **Date** were imported as text and converted to numeric and date.
- Dropped an empty junk column ('Unnamed: 22').
- Result: **zero nulls, zero duplicates, zero negatives**, single consistent currency — analysis-ready.

What was delivered

- Cleaned and quality-checked the raw 131,146-row export down to a reliable 127,200-row table.
- Defined a leakage framework separating **realized revenue** from cancelled and returned orders.
- Built a star-schema Power BI model: Date dimension, relationship, and **17 DAX measures** (revenue, leakage, rates, AOV, time-intelligence).
- Validated every measure against the SQL source to the rupee.
- Guided the build of a **two-page interactive dashboard** (KPIs, trend, category, geography, leakage, slicers).
- Translated results into a plain-language stakeholder report with prioritised actions.

Tools & skills demonstrated

Area	What was applied
SQL (MySQL)	Data profiling, CTEs, window functions, conditional aggregation, cross-tab analysis
Data modelling	Star schema, date dimension, relationships, calendar design
DAX	CALCULATE filtering, time-intelligence (MoM, running total), rate & ratio measures
Data cleaning	Deduplication, type-casting, header standardisation, null/blank handling, junk-column removal
Data quality	Profiling, artifact detection, SQL-vs-model reconciliation, honest gap-flagging
BI / dashboard	Visual selection, field-well design, Top-N filtering, interactivity
Business analysis	Leakage framework, dollar-ranked findings, concentration risk, action framing

Stakeholder Report

Performance review: April-June 2022 (3 months)

The big picture

Over three months the business earned **₹69.6M in realized (completed) revenue** from roughly 107,000 orders. The headline concern is direction: revenue fell every month (₹25.7M → ₹23.5M → ₹20.4M), and the decline is **accelerating** (−8.6%, then −12.9%). On top of that, **₹8.3M of potential revenue leaked away** through cancelled and returned orders. The encouraging news: the problems are specific and fixable, and one category is already growing strongly.

Realized revenue is declining and accelerating.

₹8.3M lost to cancellations and returns.

Where we're winning — do more of this

DO MORE	Western Dress is the growth engine — up +27% over the quarter while everything else shrank, at a healthy ₹791 order value.
KEEP	'Set' is the backbone — still #1 at ₹34.7M (half of sales) with the highest order value (₹875). Protect it.
KEEP	Strong core markets — Maharashtra (₹12.0M) and Karnataka (₹9.4M): biggest regions and among the healthiest.
DO MORE	B2B is small but high-quality — higher spend per order and rarely cancels (7.9% vs 13%).

Half of revenue comes from 'Set'.

Set down, Western Dress up.

Where we're losing money — fix or cut

FIX	Revenue is declining month over month, and accelerating. The most important trend to reverse.
FIX	The 'Set' category is collapsing (–31%). As half the business, it drives ~ 81% of the entire revenue drop (~₹4.2M) .
FIX	₹8.3M leaked to cancellations and returns. Cancellations alone (₹6.9M+) hit 13% of orders .
FIX	Two regional cancellation hotspots: Kerala (16.5%) and Andhra Pradesh (15.2%), well above the norm.
REVIEW	Merchant-fulfilled orders are returned more often (5.6%) — a quality/logistics red flag.

Cancellation rate by state — Kerala & Andhra Pradesh are the hotspots.

What's normal — healthy baseline, no action needed

NORMAL	Average order value is steady (~₹694) across regions and channels.
NORMAL	Product range is well-spread — top 10 products are only ~5% of sales.
NORMAL	A ~12-13% cancellation rate is fairly uniform — a general level to improve, separate from the two hotspots.
NORMAL	Data is clean and consistent (single currency, no gaps) — conclusions are reliable.

One risk to watch: 91% of revenue comes from just three categories (Set, kurta, Western Dress). With Set declining, that concentration is a vulnerability — though Western Dress's growth helps offset it.

Revenue concentration — 91% in three categories.

Ideas to help the business succeed

- **Rescue 'Set' first.** Investigate why it's falling (stock-outs, pricing, competition) — the biggest single lever (~₹4M).
- **Pour fuel on Western Dress.** It's already growing; give it more inventory, visibility, and marketing.
- **Attack cancellations,** starting with Kerala & Andhra Pradesh — review payment methods and checkout quality to recover part of the ₹6.9M.
- **Make a deliberate B2B push.** Small but high-value and rarely cancels.
- **Broaden the category mix** by nurturing the next tier (kurta, Top).
- **Tighten Merchant fulfilment** to diagnose the higher return rate.

Scope note: figures reflect completed (realized) revenue, April-June 2022. This is an operational performance review based on internal sales data — it measures revenue and order quality, not net profit (cost data was not available). It is not investment advice.
